Frequently Asked Questions :

1. What is UART?
Ans: UART is a hardware communication protocol used to transmit and receive serial data between devices.

2. Why use a circular buffer for UART?
Ans: It efficiently uses memory and allows continuous data transfer without shifting existing data.

3. What happens when the buffer is full?
Ans: New data may be lost due to overflow unless the buffer is managed properly.

4. Is UART synchronous or asynchronous?
Ans: UART is asynchronous because it does not use a separate clock signal for synchronization.

5. What is baud rate?
Ans: Baud rate is the number of signal symbols transmitted per second; in typical UART, it corresponds numerically to bits per second.
